Terminal/Command Prompt Commands

Basic Windows commands:

cmd command	Description	Example
cd	Change directory (go into another folder)	cd CS1/Lab1
cd..	Go back a directory/ folder level (make sure there is **NO** space between cd and ..)	No examples for these since you only write the command on its own (cd.., cls, dir)
cls	Clear screen	
dir	List directory content (Files, other folders, etc.)	

*If you want to change the **drive** that you are in, for example you want to go into your N drive instead of your C drive, you simply write the drive with a colon on the end. Example —> **N:**

Basic Mac commands:

cmd command	Description	Example
cd	Change directory (go into another folder)	cd CS1/Lab1
cd ..	Go back a directory/ folder level (make sure there **IS** a space between cd and ..)	No examples for these since you only write the command on its own (cd .., clear, ls)
clear	Clear screen	
ls	List directory content (Files, other folders, etc.)	

*For Mac, you don't have to worry about changing the drive you are in like with Windows. You simply use the cd command to change your location for anything.
